

Our dear student;

In this writing, we aim to make short reminders about your studies during the summer practice in this year.

The most important purpose of your summer practice is to transform the knowledge you have learned in theory into practical skills. For this reason, while preparing your summer practice report, it is aimed to use one or more of the solution methods you have learned in solving the problems you have found in the summer practice. For this purpose, you are requested to review the information about the summer practice on our website, examine the summer practice questions and answer all the questions. <http://mf-em.gazi.edu.tr/posts/view/title/staj-4490>

While answering the summer practice questions, you should avoid short answers, if the practice in the question is not available in the institution, you should design this practice from the perspective of an industrial engineer and try to implement it. (For example, cost calculation, operations research application, production planning, process study, etc.)

In the summer practice evaluation, especially the practical parts will be emphasized, and your summer practice performance will be evaluated in line with this information. Reports with incomplete application-oriented parts will be considered unsuccessful. Summer practices evaluated as unsuccessful will be held again in the next year.

Another issue is that there should be differences in the practice for students who do summer practice in the same company within the same summer. Even if they are practicing in the same department, if they have used the same study in their reports, their summer practice reports will still be considered unsuccessful.

We remind you of these situations and wish you success in your summer practice.

You can send your questions about summer practice to staj.gazi.enm@gmail.com
